Description

ClamAV is an excellent antivirus. But the effectiveness of any antivirus depends directly on the quality of the signatures it receives.

To improve detection rates, we offer access to **additional antivirus databases for ClamAV** from the following projects: **interServer, Linux Malware Detect, Sanesecurity, URLhaus, SecuriteInfo, ditekshen, twinclams**.

They will expand the existing ClamAV antivirus databases with an additional 3.7 million virus / Trojan /malware signatures not found in standard antivirus databases.

Access to extended updates is provided for 1 year.

Connecting additional antivirus databases takes no more than 5 minutes: you simply add an additional update source to your existing freshclam.conf configuration file.

Additional antivirus databases are updated daily.

Additional antivirus databases **are compatible with** ClamAV Linux, ClamAV Windows, ClamShield, ClamXav on macOS, and Proxmox Mail Gateway.

By connecting these extended databases to the **Proxmox Mail Gateway**, you provide even greater protection for your mailboxes from malware penetration through received email messages.
